AggieAir was contracted by Nature Conservancy to Fly Yellow Creek, a tributary of the Bear River.

AggieAir provided them with 35 river miles of RGB and thermal imagery in order to develop an ecological integrity map for Northern Leatherside chub habitat. Doing so provides the Nature Conservancy with high quality data that enables them to delineate/see areas of substandard, average, and excellent quality habitats and how to better manage those habitats.

KSL covered the research in 2016.
